How much power does a data center rack have?

While power density per rack averaged 6 kW in 2006, it climbed to about 8 kW by 2012, and is expected to approach 12 kW per rack by 2014, according to data collected by the Data Center Users Group, sponsored by Vertiv™. The need now exists for taller, wider and deeper racks to accommodate the changes in IT equipment and densities.

Are data center rack enclosures a commodity product?

At one time, data center rack enclosures and related equipment were considered commodity products—simply a platform to stack equipment, with more enclosures purchased as servers and rackmount equipment were added to the IT inventory.

What size rack should a data center have?

Taller racks, beyond the common 47U (2200 mm) are also becoming more popular as data centers with room to expand vertically take advantage of headroom. The depth of rack-mounted equipment is also increasing. For example, the greatest server depth requirements in the past resulted in a rack depth of 1200 mm.
