As colocation and service provider data center operators explore new ways to improve their facilities' resilience against grid instability, many face continued financial and environmental pressures.

The future of energy in data centers is becoming a mix of sources coupled with battery energy storage within a microgrid as the availability of power is not to be relied only in one source.

Data center microgrids offer resilience, cost savings, and sustainability - key advantages as AI-driven power demands strain the electric grid.

In-house IoT EMS hardware and software provide cost-effective solutions for managing distributed energy resources. Scalable from single asset control to complex microgrid and utility environments.
