Now, I am having some trouble with the constant current load /discharger part of the battery tester circuit. The voltage across the load resistor does not match the expected voltage as set ...

Here's a table that shows the relationship between battery capacity, C-rate, discharge time, and discharge current for lead-acid, nickel, and lithium batteries.

The "Battery University" says you should stop discharge at about 1.0 V per cell. That's the level at which most of the energy in NiMH cells is exhausted. It is not a good idea to discharge ...

Thermal runaway incidents, caused by overheating or mechanical failure, have underscored the importance of battery storage cabinets designed specifically to contain and mitigate ...

But when the battery is fully charged the grid goes to at least -2kW (on sunny days) and I see some strange behavior on the ESS. The battery is continuously changing from charging to ...

Thermal runaway incidents, caused by overheating or mechanical failure, have underscored the importance of battery storage cabinets designed ...

This article explores the science of lithium-ion charging, the engineering logic behind battery charging cabinets, and the best practices that industries should adopt when implementing a ...

This article explores the science of lithium-ion charging, the engineering logic behind battery charging cabinets, and the best practices that ...
