---

Our solar system includes the Sun, eight planets, five officially named dwarf planets, hundreds of moons, and thousands of asteroids and comets. Our solar system is located in the Milky ...

OverviewFormation and evolutionDefinitionGeneral characteristicsSunInner Solar SystemOuter Solar SystemTrans-Neptunian regionThe Solar System formed at least 4.568 billion years ago from the gravitational collapse of a region within a large molecular cloud. This initial cloud was likely several light-years across and probably birthed several stars. As is typical of molecular clouds, this one consisted mostly of hydrogen, with some helium, and small amounts of heavier elements fused by previous generations of stars.

The Solar System remains in a relatively stable, slowly evolving state by following isolated, gravitationally bound orbits around the Sun. [38] Although the Solar System has been fairly stable for ...

The Solar System is the gravitationally bound system of the Sun and all celestial bodies that orbit it. This includes planets, moons, asteroids, comets, ...

The search for life within the solar system is not just about curiosity--it's about understanding our own origins. If life can arise ...

Our solar system is made up of the sun and all the amazing objects that travel around it.

The solar system is the oldest branch of astronomy in which we discuss about the knowledge of science that deal the solar system consists of ...

All things, including galaxies and solar systems, are included within the realm of the universe. Although everything known to man is contained within the universe, scientists believe the ...
