What is INVELOX wind power capturing system?

The INVELOX attained 11.9 m/s wind speed at venturi section that is 6-8 times more power than traditional wind energy. The INVELOX system produced more power as compared to traditional wind turbines. 6 The funnel-based wind power capturing system developed with propeller blade having diameter of 7 cm that coupled with generator for producing power.

Can INVELOX reduce the cost of utility scale wind power generation?

In all, INVELOX has the potential to reduce the net cost of utility scale wind power generation by reducing installation, O&M, turbine, and land costs while improving energy production and environmental impacts. In the first glance, INVELOX appears to be another ducted turbine.

What is the difference between INVELOX and conventional wind?

While conventional wind The fundamental characteristic of the INVELOX system is that it turbines use massive turbine-generator systems mounted on top of captures a large portion of free stream air flow and can do so in a tower, INVELOX, by contrast, funnels wind energy to ground- nearly any free stream locations with flow greater than 1 m/s.

Does INVELOX increase wind speed if a turbine drops across a tower?

The performance of the system Along any part of the INVELOX tower of constant cross-section the was validated by recent measured field data. It has been shown that velocity remains the same and therefore there is no kinetic energy the increase in wind speed was maintained even when a turbine drop across the turbine.
