Astronomers anticipate an unprecedented view of the solar system as the Rubin Observatory begins to scan millions of hidden celestial objects.

These are known as Kuiper Belt objects (KBOs) and astronomers have found hints of an unexpected rise in their density far beyond where the Kuiper Belt is currently known to ...

An illustration showing Planet Nine, a hypothetical, undiscovered planet in our solar system.

Astronomers have uncovered a massive new trans-Neptunian object, 2017 OF201, lurking at the edge of our solar system. With an orbit stretching 25,000 years ...

The potential discovery of a hidden structure in the Kuiper Belt marks an exciting new chapter in our exploration of the Solar System. It challenges ...

These are known as Kuiper Belt objects (KBOs) and astronomers have found hints of an unexpected rise in their density far beyond where the ...

Is there a massive undiscovered planet on the outer reaches of the Solar System? The idea has been around since before the discovery of Pluto in the 1930s.

An Earth-sized planet may be hiding in our Solar System, according to scientists who are now searching for the planet.
