NASA's real-time science encyclopedia of deep space exploration. Our scientists and far-ranging robots explore the wild frontiers of our solar system.

The Solar System is the gravitationally bound system of the Sun and all celestial bodies that orbit it. This includes planets, moons, asteroids, comets, ...

Located inside galaxies, these cosmic arrangements are made up of at least one star and all the objects that travel around it, including ...

Our solar system's small bodies - asteroids, comets, and meteors - pack big surprises. These chunks of rock, ice, and metal are leftovers from the formation of our solar system 4.6 billion years ago.

Revolving around the sun are eight planets. The planets are divided into two categories based on their composition, terrestrial and Jovian. Terrestrial ...

Facts About Jupiter Jupiter is the largest and oldest planet in our solar system. If Jupiter was a hollow shell, 1,000 Earths could fit inside. But the "King of Planets" is no lumbering giant -- ...

What does the Solar System consist of? The solar system is huge, at least 100 astronomical units in size (15 trillion km). It is held together by the sun's ...

A Solar System comprises a central star and celestial bodies like planets, moons, and asteroids held in orbit by gravity. Physical forces and orbital mechanics ...
