What is a battery pack?

A battery pack is a set of any number of (preferably) identical batteries or individual battery cells. They may be configured in a series, parallel or a mixture of both to deliver the desired voltage and current. The term battery pack is often used in reference to cordless tools, radio-controlled hobby toys, and battery electric vehicles.

What are the components of a battery pack?

Cells: The actual batteries. These can be any type, such as lithium-ion, nickel-metal hydride, or lead-acid.

Battery Management System (BMS): This is the brain of the battery pack. It monitors the state of the batteries to optimize performance and ensure safety.

Connectors: To link the batteries together.

How does a battery pack work?

Connectors: To link the batteries together. They maintain the electrical flow and balance the load across all cells.

Housing/Casing: This protects the internal components from physical damage and environmental factors.

Battery packs work by connecting multiple individual cells in series or parallel to increase voltage or capacity.

What is a lithium-ion battery pack?

A lithium-ion battery pack is a collection of multiple lithium-ion cells connected together to store and provide electrical energy. These battery packs power various electronic devices, from smartphones to electric vehicles, due to their high energy density and rechargeable nature.
